

Evaluation of the AI

The AI was tasked with giving in-character responses based on the character Coriolanus Snow from the Novel “A Ballad of Songbirds and Snakes” after being fed information on both outer appearance, societal standing and behaviours and through processes.

Though there was not much direct speech from Coriolanus Snow himself in the Novel to go on, the language of the responses the AI gave seemed in line with both the quotes that were given and the information given on character, mannerisms, beliefs, etcetera. Although Coriolanus’s language does not have many explicit characteristics, the blunt and aloof nature of his character can be very well seen in the AI’s responses.

Another trait that was replicated well, were the beliefs held by Snow. His dark and pessimistic view of Society, where peace can only be achieved by controlled chaos, violence and oppression were mirrored well by the AI.

However, I do believe that the AI took in information from the Internet and did not limit itself to the information directly given to it. This can be seen especially well in the question on the necessity of the Hunger Games, where the AI gave a well formulated and complex answer, even though little information on the Hunger Games themselves or the society of Panem was given.

This, does not come as a surprise however, since the Hunger Games series is wildly popular and well known, especially on the internet. Even then, the responses the AI gave were impressive and accurate, and gave a good representation of Coriolanus Snow’s character.
